APPLICATION OVERVIEW DOCUMENT

Manage vehicle services, bookings, repairs, and customer updates

Congratulations on completing your application definition! This document presents a summary overview of your application as defined in the Pega platform. It encapsulates the key elements of your application's design, highlighting its core functionalities and overall structure.

Please note that this is a high-level view and does not include granular details like data models or sample data. It's an ideal resource for a quick reference, facilitating discussions among team members and stakeholders, and for guiding strategic decisions in your application development process.

Blueprint ID: BP-2423109

Application Context

The Vehicle Service Management Application is a centralized platform for managing the complete vehicle servicing lifecycle. Customers can register their vehicles, submit service requests, select required services, schedule appointments, and track service status. Service advisors can review requests, inspect vehicles, create service estimates, assign technicians, and manage appointments. Technicians can view assigned jobs, record inspection findings, update repair progress, add parts and labor details, and complete service tasks. The application tracks vehicle history, service records, spare parts, costs, invoices, and payments. Customers receive notifications about appointment confirmations, service progress, additional repair approvals, estimated costs, and service completion. Managers can monitor service operations, technician workloads, pending requests, completed services, revenue, and customer feedback through dashboards and reports. The system provides role-based access, automated status updates, approval workflows, and a transparent end-to-end service experience.

Internet Service Provider	India	Transportation & Logistics	Passenger Transportation	English

Application Architecture

Users access the application through defined channels, assume specific roles, and trigger workflows that manage how work progresses. Those workflows operate on shared Data Objects to ensure the system stays consistent and up to date.
